

~11,000m Drill Campaign Delivers Exceptional Grade Continuity – Up to 5.41g/t Au at Waihi – Resource Confidence Upgrade Pathway Confirmed

HIGHLIGHTS

- ~11,000m two-phase drill campaign now substantially complete across Korong (139koz) and Waihi (15koz) deposits, adjacent and along strike of Genesis Minerals Limited (ASX:GMD) 3.3Moz Laverton Project
- Final infill batch returned from 29 RC infill holes (1,955m) confirms consistent gold mineralisation within the existing resource envelopes at Waihi and Korong
- Results continue to demonstrate remarkable consistency of gold mineralisation across the BIF-hosted lode system at both Waihi and Korong, validating the geological model and infill drilling strategy
- Highlighted true-width intercepts include:
 - **3.2m @ 4.14g/t Au from 110m (WHRC25020A)** ○ **4.8m @ 1.51g/t Au from 11m (WHRC25033)**
 - **2.4m @ 5.41g/t Au from 87m (WHRC25026)** ○ **4.8m @ 1.31g/t Au from 108m (KORC25067)**
 - **4.1m @ 3.00g/t Au from 36m (WHRC25034)** ○ **2.9m @ 1.79g/t Au from 96m (WHRC25036A)**
 - **4.7m @ 2.56g/t Au from 63m (WHRC25035)**
- Waihi delivers standout high-grade intercepts across the full infill program and previous intercepts including:
 - **0.50m @ 10.82g/t from 91m** ○ **4.8m @ 4.46g/t (incl. 0.8m @ 13.05g/t Au)**
 - **3.2m @ 5.27g/t Au (incl. 0.8m @ 21.3g/t Au)** ○ **2.70m @ 5.71g/t from 62m**
 - **3.0m @ 4.67g/t Au (incl. 0.8m @ 16.2g/t Au)** ○ **2.4m @ 5.41g/t Au from 87m**
- **Results confirm Waihi as a high-grade deposit at 2.1g/t Au, 50% above the global 154koz resource grade**
- Updated Mineral Resource Estimate (MRE) on track for April 2026, with results to date strongly supporting a confidence upgrade of a selected portion of Korong-Waihi deposits from JORC (2012) Inferred to Indicated
- **Significant near-term assay pipeline remains:** 28 holes (2,263m) still pending across Korong & Waihi step-out drilling (including diamond) to test resource extension potential, plus regional targets (A1, Triton, Perseverance) drilling along strike

Verity Resources Limited (ASX: **VRL**, FSE: **48B0**) (**Verity** or **the Company**) is pleased to report the final batch of Phase 2 infill drilling assay results from the Waihi and Korong deposits at its 100%-owned Monument Gold

Project in the Laverton Gold District of Western Australia. These results form part of the Company's recently completed ~11,000m resource upgrade and expansion campaign, positioning the Company for an upgraded Mineral Resource Estimate (**MRE**).

Verity Director, Patrick Volpe, commented,

*"These final Phase 2 infill results reinforce what we've been seeing throughout the campaign: **a robust, repeatable BIF-hosted gold system with exceptional grade continuity** at the tighter drill spacing required for a confidence upgrade. Importantly, we are intersecting meaningful widths and grades both near surface and at depth within the existing resource envelope - exactly what we want to see as we move toward an updated Mineral Resource Estimate.*

This campaign has achieved exactly what it was designed to do. We now have a comprehensive, high-quality dataset spanning ~11,000m of new drilling combined with ~16,000m of validated historical data to underpin a resource upgrade as the next step towards progression to mine.

In parallel to the MRE upgrade, the focus now turns to the strong pipeline of extension and step out assays remaining from Korong, Waihi and multiple priority targets along the Monument trend. Each batch received to date has continued to strengthen the confidence upgrade strategy and the broader growth story at Monument."

Campaign Complete - Phase 2 Infill Drill Results

Assays were received from 29 Phase 2 infill reverse circulation (**RC**) drill holes at Waihi and Korong totalling 1,955m, completing the final batch of the Company's highly successful ~11,000m resource upgrade and expansion campaign.

The infill drilling, designed on a 25m x 25m grid, has delivered the geological and grade continuity required to support a Mineral Resource confidence upgrade from Inferred to Indicated status under JORC (2012).

Headline true-width intercepts from this final batch demonstrate continued high-grade gold mineralisation across the Waihi and Korong resource areas:

- **3.2m @ 4.14g/t from 110m** (WHRC25020A)
- **2.4m @ 5.41g/t from 87m** (WHRC25026)
- **4.1m @ 3.00g/t from 36m** (WHRC25034)
- **4.7m @ 2.56g/t from 63m** (WHRC25035)
- **4.8m @ 1.51g/t from 11m** (WHRC25033)
- **4.8m @ 1.31g/t from 108m** (KORC25067)
- **2.9m @ 1.79g/t from 96m** (WHRC25036A)

These results are consistent with every previous batch received throughout the campaign, confirming gold mineralisation is hosted within the BIF main lode with outstanding repeatability and continuity across the entire infill drilling pattern. The remarkable consistency of intercepts – both in grade and width – across all sections drilled at Waihi and Korong provides a compelling foundation for the upgraded MRE.

Waihi – A High-Grade Deposit Confirming Substantial Growth Potential

The 15koz Waihi deposit has returned an exceptional series of high-grade results throughout the Phase 2 drilling campaign, confirming that Waihi hosts some of the highest gold grades across the global 154koz MRE. At 2.1g/t Au, Waihi's resource grade is 50% higher than Korong (1.4g/t) and the infill campaign has consistently returned intercepts that reinforce this high-grade character.

Combined Phase 2 infill results at Waihi across all batches and historically validated intercepts that include standout true-width intercepts of:

- **0.50m @ 10.82g/t from 91m (MK033)**
- **3.2m @ 5.27g/t from 25m including 0.8m @ 21.3g/t (WHRC25007) – *step out hole***
- **2.70m @ 5.71g/t from 62m (WHRC005)**
- **3.0m @ 4.67g/t from 71m including 0.8m @ 16.2g/t (WHRC25039)**
- **2.4m @ 5.41g/t from 87m (WHRC25026)**
- **4.8m @ 4.46g/t from 60m including 0.8m @ 13.05g/t (WHRC25031)**
- **3.2m @ 4.14g/t from 110m (WHRC25020A)**
- **4.1m @ 3.00g/t from 36m (WHRC25034)**
- **4.7m @ 2.56g/t from 63m (WHRC25035)**
- **2.80m @ 4.82g/t from 36m (MK032)**
- **4.20m @ 3.55g/t from 29m (WASC03)**
- **2.10m @ 2.45g/t from 113m (WHRC010)**
- **2.4m @ 1.75g/t from 17m (WHRC25005) – *step out hole***
- **6.5m @ 0.86g/t from 28m (WHRC25004) – *step out hole***

The significance of the Waihi grade profile is that it demonstrates the BIF-hosted mineralisation system at Monument can deliver **economically compelling grades over meaningful widths**, both at shallow depths (3.2m @ 5.27g/t from just 25m) and at depth (3.2m @ 4.14g/t from 110m).

The current 15koz resource reflects the limited drilling extent at Waihi rather than a lack of grade. The deposit remains open along strike and at depth, with step-out drilling to date confirming mineralisation extends beyond the current resource boundary (3.2m @ 5.27g/t including 0.8m @ 21.3g/t). Further step out drill assays are pending.

Figure 1. Long Section view of recently completed drilling with assays, looking from the hanging wall down onto plane of mineralisation. Outline of the current 15koz Au Inferred Resource is shown (black). 150m mineralised extensions to current resource envelope from step out drilling, further assays pending.

Figure 2. Representative cross section A-A' through the core of the Waihi mineralisation showing the BIF main mineralised lode.

Figure 3. Long Section view of recently completed drilling with assays, looking from the hanging wall down onto plane of mineralisation. Outline of the current 154koz Au Inferred Resource is shown (black).

Successful Infill Drill Campaign Feeds Directly Into Updated MRE

The drill campaign comprised a substantial, two-phase resource upgrade and expansion program totaling ~11,000m, including Phase 1 RC drilling at Korong, Phase 2 RC and diamond drilling across Korong and Waihi, plus an additional ~1,500m of exploration drilling on regional targets.

Earlier results from the campaign had already confirmed strong continuity at Korong and Waihi and supported the Company's strategy of upgrading portions of the resource to higher confidence categories. This final batch materially strengthens that outcome by demonstrating that the same repeatable style of BIF-hosted mineralisation extends through the later stages of the infill pattern at Waihi and Korong.

With the drilling program now completed, the Company is progressing interpretation, modelling and estimation work toward an updated Monument Mineral Resource Estimate, which is expected in April 2026.

The updated MRE is expected to reflect the significantly improved drill density and strengthened geological confidence generated by the 2025–2026 drilling campaign.

Upcoming Catalysts

Assays remain pending from 28 holes for 2,263m of the broader Monument drilling program, including:

- Step-out drilling results at Korong and Waihi – with mineralisation already confirmed beyond the existing resource boundaries at both deposits
- Exploration results from the Triton, A1 and Perseverance prospects along the broader Monument corridor, where gold mineralisation has previously been confirmed at every prospect tested
- Geological modelling and estimation work underway
- Updated Monument MRE expected April 2026, incorporating all ~11,000m of new drilling combined with ~16,000m of validated historical data
- Ongoing assessment of regional BIF and intrusion-related targets across the enlarged ~405km² Monument footprint

The Company will continue to report results progressively as they are received.

Monument Gold Project

The Monument Gold Project is in WA's world-class Laverton Gold District and comprises ~405km² of tenure located approximately 40km west of Laverton, adjacent and along strike of Genesis Minerals' (ASX: GMD) **3.3Moz Au Mt Morgan Project**. A Mineral Resource Estimate of 154koz of gold (see ASX announcement on 2 August 2021) was undertaken on the Korong and Waihi deposits, which occur along ~20km of relatively untested banded iron formation, interpreted to be the same unit that hosts the 1.4Moz Westralia gold deposit, located immediately southeast of Monument.

Critically, only ~10% of the potential 20km BIF strike length has been drilled with detailed air core and reverse circulation drilling to date, leaving substantial exploration upside. A further approximately 60 priority targets have been identified along the banded iron formation horizon and broader syenite-intrusion hosted settings, representing significant resource upside potential beyond the current Korong and Waihi deposits.

Figure 4. Monument Gold Project location in the Laverton Gold District amongst major gold deposits.

Figure 5. Monument Gold Project location adjacent to Genesis Minerals' 3.3Moz Mt Morgan Project

This announcement has been authorised for release by the Board of Verity Resources Limited.

About Verity Resources

Verity Resources owns 100% of the Monument Gold project located near Laverton in Western Australia. This project currently has a JORC-compliant (2012) Inferred resource of 3.257 Mt @ 1.4 g/t for 154,000 ounces Au. (inferred resources calculated by CSA Global in 2021 to JORC 2012 compliance using a 0.5 g/t cut-off grade; see 2 August 2021 ASX announcement "Mineral Resources Estimate declared for Monument Gold Project "for further information).

Verity Resources also holds a supply critical metals portfolio via a joint venture that includes rare earth elements, lithium, gold, base and precious metals in Brazil, including licences in the "Lithium Valley" and Poços de Caldas in the state of Minas Gerais, globally known as prolific lithium and rare earth elements districts respectively. The Company also owns 70% of the Pimenta Project, a potential large-scale REE project in eastern Minas Gerais.

Verity Resources also holds 100% of large critical metals projects in the Limpopo Mobile Belt in Botswana, a district known for hosting major nickel and copper-producing operations. The Company's Botswana portfolio contains three flagship projects where high-grade Cu-Ag (Airstrip and Dibete) and a Maiden JORC Inferred Resource (Maibele North) have been discovered. Maibele North currently hosts a JORC (2012) inferred resource of 2.4Mt @ 0.72% Ni and 0.21% Cu + PGE's + Co + Au and is located within 50km of the Selebi-Phikwe mine recently acquired by NASDAQ-listed NexMetals Mining Corp. (NASDAQ:NEXML).

Competent Persons Statement (Monument Gold Project, Western Australia)

The information in this report that relates to Exploration Targets and Exploration Results is based on recent and historical exploration information compiled by Mr Michael Jackson, who is a Competent Person and a Member of the Australian Institute of Geoscientists. Mr Jackson is a consultant to Verity Resources Limited. Mr Jackson has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the "Australasian Code for the reporting of Exploration Results, Mineral Resources and Ore Reserves". Mr Jackson consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

Disclaimer

In relying on the above mentioned ASX announcement and pursuant to ASX Listing Rule 5.23.2, the Company confirms that it is not aware of any new information or data that materially affects the information included in the above announcement. No material exploration data or results are included in this document that have not previously been released publicly. The source of all data or results have been referenced.

Forward-Looking Statements

This document may include forward-looking statements. Forward-looking statements include, but are not limited to, statements concerning the Company's mineral properties, planned exploration program(s) and other statements that are not historical facts. When used in this document, the words such as "could," "plan," "estimate," "expect," "intend," "may," "potential," "should," and similar expressions are forward looking statements. All such statements are subject to certain risks and uncertainties, many of which are difficult to predict and generally beyond the control of the Company, which could cause actual results to differ materially from those expressed in, or implied or projected by, the forward-looking information and statements. Our audience is cautioned not to place undue reliance on these forward-looking statements that speak only as of the date hereof, and we do not undertake any obligation to revise and disseminate forward-looking statements to reflect events or circumstances after the date hereof, or to reflect the occurrence of or non-occurrence of any events.

Monument Gold Project, Western Australia, Resource Information

Korong Resource			
Deposit	Tonnes	Grade (g/t)	Au (Oz)
Korong	3,034,000	1.4	139,000
Waihi	223,000	2.1	15,000
Total	3,257,000	1.4	154,000

Table 1: Inferred Resource was calculated at Korong and Waihi by CSA Global Pty Ltd in 2021 (see Table 2) using a 0.5g/t cut-off grade. See ASX announcement on 2 August 2021 "Mineral Resource Estimate Declared for Monument Gold Project".

Reference to Previous Announcements

The information in this announcement that relates to exploration results is extracted from the following Company announcements released to the ASX:

JORC Code, 2012 Edition – Table 1

Appendix A – JORC CODE, 2012 Edition

Section 1 – Sampling Techniques and Data

Criteria	JORC Code explanation	Commentary
Sampling techniques	• <i>Nature & quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling.</i> • <i>Include reference to measures taken to ensure sample representivity & the appropriate calibration of any measurement tools or systems used.</i> • <i>Aspects of the determination of mineralisation that are Material to the Public Report.</i> • <i>In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.</i>	Reverse circulation (RC) percussion chip samples were collected at 1m intervals from a rig mounted cyclone and cone splitter, split into 2 to 2.5kg sub-samples and collected into pre-numbered calico bags. Diamond Drill core is cut in half longitudinally and half HQ core samples were submitted for assay analysis. Sampling was generally undertaken on 1m intervals subject to geological context, with a minimum sample length of 0.2m and a maximum samples length of 1.2m. The half core samples were placed into pre-numbered calico bags. The calico bag sub-samples were then submitted to an independent laboratory where the entire sample was pulverised to a nominal sample weight for Fire Assay analysis (see Quality of assay data and laboratory tests below).
Drilling techniques	• <i>Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc.) & details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented & if so, by what method, etc.). If no site visits have been undertaken indicate why this is the case.</i>	Reverse Circulation (RC) All RC drilling was undertaken using 5½ to 5¾ inch face sampling bits. Diamond Drilling involved HQ diameter coring with electronic backend core orientation for all runs in competent fresh rock.
Drill sample recovery	• <i>Method of recording & assessing core & chip sample recoveries & results assessed.</i> • <i>Measures taken to maximise sample recovery & ensure representative nature of the samples.</i> • <i>Whether a relationship exists between sample recovery & grade & whether sample bias may have occurred due to preferential loss/gain of fine/coarse material</i>	Reverse Circulation (RC) Continuous visual monitoring and assessment of sample recoveries was undertaken by suitably qualified field staff (contract geologist and senior field assistant). Where low recoveries or wet samples were identified these were recorded in the field sample data. To aid in achieving high recoveries and maintaining a dry sample a support truck mounted air booster was used when necessary. There is no evidence of sample bias. Diamond

		Core recovery is logged as part of the geological logging process. Zones of partial recovery are logged as such, zones of no recovery are logged as intervals of core loss. Diamond drillers use short runs to maximise recovery in poor ground conditions. Competent core is considered representative. The only risks to the representivity of diamond core relate to selective recoveries in highly broken ground or hole cave in. No relationship exists between recovery and grade.
Logging	• Whether core & chip samples have been geologically & geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies & metallurgical studies. • Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc.) photography. • The total length & percentage of the relevant intersections logged	Reverse Circulation (RC) RC chip logging was undertaken by a suitably qualified contract geologist who also monitored quality of sampling. Logging of RC chips was undertaken by wet sieving a representative portion of the overall 1m sample recovered from the cyclone and collecting a sub-sample into a labelled, 20 compartment chip tray. The logging is considered qualitative with weathering, lithology, alteration, quartz veining and presence of sulphides recorded in the logging template. All chips trays were labelled with hole ID and sample depth and photographed for future reference. Logging and sampling of percussion chips at 1m intervals is considered the preferred RC sample interval to use in Mineral Resource Estimation. Diamond Core recovery is logged as part of the geological logging process. Zones of partial recovery are logged as such, zones of no recovery are logged as intervals of core loss. Diamond drillers use short runs to maximise recovery in poor ground conditions. Competent core is considered representative. The only risks to the representivity of diamond core relate to selective recoveries in highly broken ground or hole cave in. No relationship exists between recovery and grade.
Sub-sampling techniques & sample preparation	• If core, whether cut or sawn & whether quarter, half or all core taken. • If non-core, whether riffled, tube sampled, rotary split, etc. & whether sampled wet or dry. • For all sample types, the nature, quality & appropriateness of the sample preparation technique. • Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples. • Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.	Reverse Circulation (RC) All RC percussion sample material was passed through a rig-mounted cyclone with a cone splitter attached to the base and collected at 1m intervals into pre-numbered calico bags. At the completion of each 6m drill rod the cyclone and cone splitter were cleaned to avoid contamination. Duplicate Quality Control (QC) samples were taken every 60 samples as an identical split in conjunction with the corresponding original sample. Certified reference materials obtained from an external, independent supplier were inserted every 60 samples.

	• <i>Whether sample sizes are appropriate to the grain size of the material being sampled.</i>	Sample preparation was undertaken at an independent laboratory. Samples were dried and pulverised to 85% passing 75µm. Sample sizes are considered appropriate for the size and nature of the material being sampled. Diamond Core sampling involved: Longitudinally cutting the core in half with an automated core saw which is appropriate for this style of mineralisation. Half core is subject to two-stage crushing down to 2mm then pulverisation to 75 micron to produce the final assay subsample. Lab duplicate samples are inserted every 50 samples by taking a second 75 micron pulp from the duplicate interval. Blank samples are inserted every 60 samples and adjacent to apparent mineralisation to monitor for contamination in the crushing and pulverisation stages. Second half core sampling is not used in the exploration stage, however the core is archived should this be required in the future. The sub sampling and crush/pulverisation sizes are appropriate for the material being sampled.
Quality of assay data & laboratory tests	• <i>The nature, quality & appropriateness of the assaying & laboratory procedures used & whether the technique is considered partial or total.</i> • <i>For geophysical tools, spectrometers, handheld XRF instruments, etc., the parameters used in determining the analysis including instrument make & model, reading times, calibrations factors applied & their derivation, etc.</i> • <i>Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) & whether acceptable levels of accuracy (i.e. lack of bias) & precision have been established.</i>	RC percussion & diamond samples were analysed for gold using 50 gram Fire assay with an Inductively Coupled Plasma (ICP) finish. This technique is considered suitable for determination of gold for this project. Fire assays are classified as total assays. Samples were analysed at ALS Laboratories located in Perth, Western Australia. In addition to QC measures implemented by VRL, internal audits were undertaken by the Laboratory including the use of internal reference materials, blanks and duplicates. Standard, blank and duplicate QAQC performance reports compiled by an external database consultant have been checked by VRL and demonstrate an acceptable level of accuracy.
Verification of sampling & assaying	• <i>The verification of significant intersections by either independent or alternative company personnel.</i> • <i>The use of twinned holes.</i> • <i>Documentation of primary data, data entry procedures, data verification, data storage (physical & electronic) protocols.</i> • <i>Discuss any adjustment to assay data.</i>	Assay data has been loaded into the company database with significant intercepts checked and validated using 3D geological software. Drilling data is captured using Excel data entry templates which are then loaded into an Access database by an external database consultant.
Location of data points	• <i>Accuracy & quality of surveys used to locate drill holes (collar & down-hole surveys),</i>	Drill collars were picked up by a surveyor using a differential GPS including relative level (RL)

	trenches, mine workings & other locations used in Mineral Resource estimation. • Specification of the grid system used. • Quality & adequacy of topographic control	Down-hole surveys recording dip and azimuth were collected every 10m down- and up-hole using a Gyro survey tool. All data points are recorded in the GDA94, zone 51 south coordinate system.
Data spacing & distribution	• Data spacing for reporting of Exploration Results. • Whether the data spacing & distribution is sufficient to establish the degree of geological & grade continuity appropriate for the Mineral Resource & Ore Reserve estimation procedure(s) & classifications applied. • Whether sample compositing has been applied.	RC and diamond drilling was undertaken on a nominal 25m x 25m grid. Step out diamond drilling was aimed to intersect approximately 100m down plunge of nearest historical drill intersection for Korong and 70m for Waihi. A previous geological/geostatistical study by external consultants and reviewed by Verity geologists determined that 25m x 25m intercept spacing should be sufficient to achieve indicated resource status in future mineral resource estimates. This analysis will be verified on completion of this drill program and return of all assay results. Samples were not composited prior to laboratory submissions, however reported intercepts are composites of multiple samples.
Orientation of data in relation to geological structure	• Whether the orientation of sampling achieves unbiased sampling of possible structures & the extent to which this is known, considering the deposit type. • If the relationship between the drilling orientation & the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed & reported if material	RC & diamond drill holes at Korong and Waihi are designed to be drilled as close as possible to perpendicular to the plane of mineralisation. At Korong, reported intercepts in holes drilled at -60 dip are close to true thickness. The difference between down-hole thickness and true thickness will be allowed for in Mineral Resource Estimation.
Sample security	• The measures taken to ensure sample security the different materials.	Individual samples were collected into pre-numbered calico sample bags, placed into larger polyweave bags and then cable tied. Polyweave bags were placed in larger secured bulka bags and dispatched to the laboratory via a contract transport company.
Audits or reviews	• The results of any audits or reviews of sampling techniques & data.	Drilling and sampling audit undertaken by Cube Consulting in November concluded that all drilling methods, sampling methods & data capture methods were of a high standard and in line with best practice.

Section 2 Reporting of Exploration Results

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	- Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. - The security of the tenure held at the time of reporting along with any known impediments to obtaining a license to operate in the area.	All Waihi drilling is located on Exploration Licence E39/1866, held under the Mining Act 1978 (WA). The tenements are held by Monument Exploration Pty Limited, a wholly owned subsidiary of Verity Resources Limited. Royalties of up to 2% of gross revenue are held by prior owners of the Monument Project.
Exploration done by other parties	Acknowledgment and appraisal of exploration by other parties.	Exploration was undertaken by Carpentaria Exploration Pty Ltd between 1977 and 1988 and by Carpentaria Gold Pty Ltd between 1994 and 1995. Eighty two (82) RC holes, and 15 Diamond Drill Holes were completed during this period. A total of 7,459 metres of drilling was reported principally at the Korong and Waihi Prospects with gold mineralisation the principal target. Western Mining Corporation completed follow up drilling between 1989 and 1993 with gold and nickel mineralisation the focus principally at the Anomaly 39 prospect. 38 RC holes and 5 diamond holes were completed for 1,993 metres. Cedardale and Marengo Mining Limited drilled nine RC holes in 2003 to incrementally advance the project. In 2016 and 2018 Syndicated Metals undertook the first modern drill programs to substantially advance the project toward a resource. A drill program by Verity Resources (then called SI6) in 2021 allowed for a mineral resource estimate and inferred mineral resource later that year.
Geology	Deposit type, geological setting and style of mineralisation.	The Monument Gold Project (MGP) is located on a north-westerly trending sequence of Archaean meta-volcanics and meta-sediments intruded by mafic and felsic rocks. This sequence forms the western limb of the major south-southeast plunging Mt Margaret Anticline which is cored by a complex granitoid batholith. The sequence generally dips vertically or steeply to the east. The 1.4-million-ounce Mt Morgan's gold deposit, hosted by banded iron formation (BIF), lies to the south and east along strike from the MGP project tenements. The Korong and Waihi resources are located in relatively weakly deformed (by orogenic gold

		standards) BIF packages with quartz veining and fine sulphides throughout. These textures are interpreted as a chemical replacement of magnetite by sulphide in the presence of gold-bearing fluids that have also recrystallised cherty layers of the BIF. The MGP BIF sequence is about 100 m thick and consists of several individual BIFs separated by intercalated metasiltstones, minor ultramafic rocks and massive and pillowed basalts. It dips steeply to the east and faces westwards. Thus, a possible overturned limb of an anticline.
Drill hole Information	• A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: • easting and northing of the drill hole collar • elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar • dip and azimuth of the hole • down hole length and interception depth • hole length. • If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.	All holes drilled in this drill campaign are listed in Appendix A All intercepts of the main target zone are listed in Appendix B regardless of the outcome.
Data aggregation methods	• In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated. • Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. • The assumptions used for any reporting of metal equivalent values should be clearly stated.	All intercepts are reported as the length weighted average gold grade across the geological context of mineralisation, that being the veined zone of the BIF stratigraphy. Intercepts are reported in that context regardless of the grade of the intercept. The strong stratigraphic control on mineralisation means that intercepts reported in this geological context are very similar to a rigid 0.5g/t cut off grade criteria for reporting, however the geological criterion is appropriate at this stage of the project. This mineralisation style does not commonly involve extreme outlier grades, and no top cut is applied to reported intercepts.
Relationship between mineralisation widths and intercept lengths	• These relationships are particularly important in the reporting of Exploration Results. • If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. • If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').	The geometry of mineralisation is well understood and all intercepts are reported in true width unless otherwise stated.

Diagrams	• <i>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</i>	A location plan of each of the prospects showing the drill collars is provided in the body of this report.
Balanced reporting	• <i>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</i>	The report is considered balanced with the information provided. The report shows drill collars for all holes completed.
Other substantive exploration data	• <i>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</i>	Metallurgical and geotechnical studies have begun for this project, but no results are available at the time of this report.
Further work	• <i>The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling).</i> • <i>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</i>	Collation of data in preparation for MRE update upon receipt of finalised results.

Appendix A – Drill Hole Information

List of all drill holes in the RC resource upgrade drilling Phase 2. Blue shaded holes relate to the results the subject of this announcement.

Appendix B – Resultant Intercepts

List of the Korong Main Lode intercepts from RC resource upgrade drilling phase 2. Results are reported to nominal 0.5g/t grade cut off which is overridden where appropriate to better match the geological context (veined banded iron formation (BIF) horizon. All intercepts of the target horizon are shown regardless of the outcome. **Blue shaded rows relate to the results the subject of this announcement.**
